AB Studies have been aimed to establish the structure-activity relationship that define choline kinase (ChoK) inhibitory potency and antiproliferative activity of a set of 25 bispyridinium compds. with electron-releasing groups at position 4. Here we report that, according to their inhibitory activities against human ChoK, the enzymic inhibitory potency is closely related to the size of the linker, the 3,3'-biphenyl moiety being the most

suitable. The N-methylanilino and its derivs., 4-chloro-N-methylanilino and 3,5-dichloro-N-methylanilino, render higher ChoK inhibitory and antiproliferative activities against the HT-29 human colon cancer cell line.
